Front End

- In order to test the front end, we simply tested each front end functionality individually to make sure they worked as intended.
- For submission fields, we test multiple inputs to see which would work, and we reported instances where they broke the submission.
- For buttons, we checked that their functionality and redirection was working as intended.

Back End

- DoAll(): Was eventually modified for required setup of the SQL tables, but we used it to call our ADT functions initially, adding users, modifying times, and deleting users, and used showUsers() to ensure correctness of all fields.
- DoGroup(): Similar to above, but for the group SQL tables, and group related functions. Used showGroups(), which shows the group and the users associated with it, to make sure the lower level groupDB functions operate bug-free.
